

Sprint 3: 2/13/2023 - 2/19/2023**What went well?**

Abhay	This time there was more communication, and better setting of deadlines. Which lead to some work being done, as opposed to nothing being done.
Anh	Coding and research went well for me.
Aster	Despite the emergency, time was still manageable.
David	I was able to complete most of the code for account recovery. I was able to make an automated email system for sending OTP to verify the user is the one requesting to recover the account.
Sierra	I was able to create an WebAPI and website for user registration and connect them to the database using fetch.

What went wrong? / what could be improved?

Abhay	There was nothing particularly wrong, but I still am having problems sticking to the capacity I gave. It was better than last sprint, but now I am going to keep fill the burndown charts daily instead of at the end of sprint. To understand how much work is needed to be done and how much I am off my schedule.
Anh	I was behind my set deadline by a day.
Aster	I feel behind due to lack of understanding of the new project and code
David	I was having alot of issuses with making my code into a webapp and making it work on a server so I ended up leaving it as a console application for now until I am able to learn more or recieve assistance. I was also slow coding it as I was unfamiliar with using a mvc web app format.
Sierra	I was not able to get the user input from the website to be inserted into the database, it just shows the type of each parameter instead of the actual input. I can improve that by researching the error.

How can we improve?

Abhay	Better planning, and assignment of work. With deadlines so we do not face the same problems as last semester.
Anh	A morale booster would be nice.
Aster	Need to research more code and other documents of the project
David	I will use this next weekend afternoons to research the MVC webapp format for a couple hours each day and learn what each file and folder does so that I can implement my code into it. I will also try to implement my code into it along with my teammates to get the base running.
Sierra	The team can improve by better/equally dividing up work during the sprint planning. We can also improve by making deadlines outside of the semester schedule to ensure that work items are done on time.
