Sprint 7: 3/12/2023 - 3/19	/2023										
What went well?											
Abhay	I was able to set up and framework for both frontend and backend. I was able to set a coustom CORS middleware, which solved all the problems we had with cors. And because of that I was able to work on the frontend for Property Evaluation.										
Anh	I now know that my services need a frontend to be able to interact with the API, so I know what to work on.										
Aster	I was able to make the proper LLD for Document Storage Delete matching to HLD										
David	I was able to fix and make the back end work properly and started to work on integrating the code with other members code.										
Sierra	I was able to complete intergration test for request management and will move on to refactoring the frontend HTML and CSS code. The team was able to fix the cors error that stumped our frontend development process last sprint.										
	What went wrong? / what could be improved?										
Abhay	I was not able to serialize claims and store it in the cookie. And while fixing other bugs, I was not able to complete the frontend for Property Evaluation. So, I will be working on that.										
Anh	I havn't had much time to work on my tasks at all; I am falling a bit behind on schedule.										
Aster	I am not actively updating the daily standup and burndown chart everyday as needed and other group members are lacking information on what I am doing each day.										
David	I had issues and got stuck for a couple days on integrating the code to work with other member codes. It could have been improved if I spent more time in the begining looking at the structure of other members code and if we all worked together to create a default structure but we mostly started out coding individually.										
Sierra	There is still a lack of communication within the team and honesty between all memebers. Work is getting done slower than expected and we are behind schedule.										
How can we improve?											
now can we improve?											

Abhay	If other members spent more time researching, I wouldn't have to be the only one to debug these systems, and also create frameworks alone. So, again like last sprint I recommend people to research Javascript and Controllers more. And as for the uncomplete work from last semester, it will assigned top of the next sprint to be completed asap.									
Anh	I think our code as of now is very compartmentalized, and people are working on almost separate software technologies. I think it'd be better if we can find a way to unite the code together somehow.									
Aster	I will finish daily standup each day before starting my work, which will be around the nighttime of each day. And the burndown chart will also be updated as soon as I am done with my work to be done of that day, which will be in the twilight of next day. The daily standup and burndown chart will be updated by 12am and 4am, respectively.									
David	I will start consistently updating the code to github whenever any single task is completed so that there is a constant checks for my team members to review my code rather than pushing to github once the project is completely done. This should also make it easier for teammates to understand my code as they can review function by function and not immediately see all the code and files of the completed feature.									
Sierra	We need to start communicating more on what we are doing each day and what we have completed. I think we should rotate responsibility for uploading the scrum documents, checking for completeness and creating new ones for next sprint.									
Concrete Action Plan To S			Completeing I	By Next Sprint
